HOME VIDEO GAME SYSTEM

This documentation describes the Bally Home Video Game System. The description begins with a discussion of the major sub-sections of the system. Following this, each sub-section is presented in greater detail, with detailed particulars, such as calling sequences and resource use.

The major sub-sections of the system are:

The User Program Interface...which allows cassettes to reference the system routines through a standard interface. Includes an interpreter.

The Screen Handler...a complex of routines for creating screen images. Includes facilities for initialization, pattern, and character display, co-ordinate conversion, and object vectoring.

The Interrupt Processor...decrements timers, plays music, and produces sounds.

The Human Interface...reads keypad and control handles, inputs game selection and options.

Math Routines...a package of routines for manipulating floating BCD numbers.

DO NOT REPRODUCE

Dave Nutting Associates, Inc.

PROPRIETARY INFORMATION

USER PROGRAM INTERFACE

The User Program Interface (UPI) is a set of procedures and conventions, which are utilized by a cassette program to access the facilities provided by the home video game system. By adhering to these conventions a cassette program will be system independent, thus allowing improvements to be made to later versions of the system and on-board games, while maintaining upward compatability.

The basic rule for using the UPI is:

With exception to the system DOPE vector, no cassette should ever address system ROM directly, or expect a given cell to always equal a certain value.

The mechanism for calling a system routine is:

```
RST      #
DEFB     (routine # + option)
```

where routine number is an even number specifying which sub-routine to transfer to, symbolic identifiers, which are equated to routine numbers, are provided in HVGLIB.

Option is used to specify how arguments are being passed to the system routine. If option equals zero, the arguments are presumed to exist in CPU registers; if option equals 1, the arguments are taken to follow in line after the routine number/option byte. These arguments are loaded into the CPU registers automatically before the called routine is entered. The arguments required by each system routine are given in the routine's detail documentation.

The SYSTEM macro generates the sequence previously mentioned with option = 0:

```
SYSTEM (routine #)
```

(example)

```
SYSTEM FILL
```

The SYSSUK macro generates the sequence previously mentioned with option = 1:

```
SYSSUK (routine #)
```

Frequently it is desirable to string several system routine calls together. If four or more calls follow in sequence, it is more efficient to utilize the interpreter. By using the interpreter we void the overhead of the RST 56 instruction by expecting a call index to immediately follow the call index or arguments used by the previous system routine.

Special call indexes are used to enter and exit interpretive mode:

Example:

SYSTEM	INTPC	;BEGIN INTERPRETING
DO	FILL	;DO FILL ROUTINE
DEFW	NDIEM	;STARTING AT TOP OF SCREEN
DEFW	92*BYTEPL	;CONTINUING FOR 92 LINES
DEFB	0	;FILLED WITH ZEROS
DO	CHRDIS	;DO CHARACTER DISPLAY ROUTINE
DEFB	0	;Y-AXIS POSITION OF CHARACTER
DEFB	10	;X-AXIS POSITION OF CHARACTER
DEFB	8	;OPTIONS-PLOP,10-ON,00-OFF
DEFB	'A'	;CHARACTER TO BE DISPLAYED
EXIT		;EXIT INTERPRETER

DO NOT REPRODUCE

Data Mining Associates, Inc.

PROPRIETARY INFORMATION

A block of call indexes have been set aside for the internal use of cassette programs. If a negative call index is encountered, the user's macro routine address table and argument table are utilized. The user is responsible for storing the addresses of these tables into dedicated system RAM cells.

All UPI routines are re-entrant.

Registers which are not defined as containing output parameters will not change.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SYSTEM ROUTINE CONVENTIONS

A system routine is coded like a conventional machine language subroutine, with the exception that output parameters are not passed through registers, but rather through the context block.

The context block is created by the RST 56 call. The user's register set (AF, BC, DE, HL, IX, IY) is pushed onto the stack. Register IY is set to point at this stack frame. Thus a copy of the input arguments exists in RAM which the system routine may refer to as needed. These arguments are also present in the registers when the system routine is entered, hence it is only necessary to refer to the context block when one has clobbered an input argument.

An output argument is returned to the caller by setting it in the context block. If a register was changed, but the associated cell in the context block was not, then the register will have its old value on return. Thus a system routine is free to use any of the registers it needs without concern to saving and restoring. Moreover, the user can assume that no registers will change except those defined as returning an output argument.

The following illustration describes the context block and equates provided in HVGLIB for each field.

Four tables are used by the UPI in the control transfer process. The first two tables give the routines starting address indexed via call number. The systems table is named SYSDPT. The user may extend this table by storing the address of his extended table into USERTB, USERTB+1. This address should point 128 bytes before the first entry.

DO NOT REPRODUCE
 PROPRIETARY INFORMATION
 Please Notify: *Shantanu, Inc.*

The other two tables describe what in line arguments a call that specifies in line arguments should expect. This table gives a one-byte bitstring, also indexed via call number. The systems name is MRARGT, the user's address is in UMARGT, UMARGT must point 64 bytes ahead. Arguments must follow the call in a specified order.

Note that the context contains additional information not shown. This information exists both above and below the context. User programs should never use this information or even assume that it exists. The user should only address this area by using IY.

Please Nothing Associated, Mac

DISPLACEMENT	MEMORY CELL	EQUATE NAME
0		CB IYL
1		CB IYH
2		CB IXL
3	IX	CB IXH
4	E	CB E
5	D	CB D
6	S	CB C
7	B	CB B
8	FLAGS	CB FLAG
9	A	CB A
A	L	CB L
B	H	CB H

CONTEXT BLOCK FORMAT

IN LINE ARGUMENT MASK TABLE ENTRY

TABLES MRARGT and UMARGT

If a bit corresponding to a register is set, the register is loaded.
The order in which the arguments must appear is:

IX (L then H), E, D, C, B, A, L, H

If an argument isn't specified, it is omitted.

PROPRIETARY INFORMATION

UPI INTPC
BEGIN INTERPRETING

Calling Sequence: SYSTEM INTPC
Aruguments: None
Notes: None
Description:

See UPI description for explanation of interpretation

DO NOT REPRODUCE

Dave Nutting Associates, Inc.

PROPRIETARY INFORMATION

UPI XINTC
EXIT INTERPRETER

Calling Sequence: EXIT
Arguments: None

Description:

This code causes the interpreter to exit. Execution of machine instructions proceeds at the following location.

Restrictions:

This routine should only be called using the interpreter. A direct system call would produce unpredictable (and catastrophic) results.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

UPI MJUMP
 INTERPRETER JUMP

Calling Sequence: DO MJUMP
 or
 DONT MJUMP
 DEFW (goto address)

Arguments: HL=Go to address

Description:

The current interpretive program counter is set to the contents of HL.
 The next instruction is fetched from that address.

Restrictions:

MJUMP must be called from the interpreter. The targets of all JUMPS
 must also be interpreted sequentially.

Example:

	SYSTEM	INTPC	ENTER INTPC STEP
	.	.	.
	.	.	.
	DO	MJUMP	;JUMP TO END OF
	DEFW	END	;INTPC STEP
	.	.	.
	.	.	.
	.	.	.
END:	DEFB	XINTC	;EXIT INTERPRETER

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

UPI MRET
RETURN FROM INTERPRETIVE SUBROUTINES

Calling Sequence: DO MRET
Arguments: None

Description:

MRET causes execution to proceed at the instruction following the corresponding MCALL instruction. See MCALL for more information.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN HANDLER

The screen handler is a group of routines for generating frame buffer images. Included are entries for filling sections of the screen with constant data, the animation of figures, and the display of alpha-numeric.

Many of these routines utilize the MAGIC functions provided by the custom chips. Since the status of these chips cannot be context-switched, many of these routines are not re-entrant. The user is responsible for preventing conflicts. This can be done by disabling interrupt, or implementing a semaphore.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN SETOUT
SET DISPLAY PORTS

Calling Sequence: SYSTEM SETOUT
 or
 SYSSUK SETOUT
 DEFB BLINE*2
 DEFB HORIZX/4
 DEFB INMOD

Arguments: A=Data to output to INMOD (port EH)
 B=Data to output to HOP (port 9H)
 D=Data to output to VEP (port AH)

Output: None

Description: Outputs above data to ports
 See hardware writeup for discussion of
 above ports.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN RECTAN
PAINT A RECTANGLE

Calling Sequence: SYSTEM RECTAN
or

SYSSUK RECTAN
DEFB (X co-ordinate)
DEFB (Y co-ordinate)
DEFB (C size)
DEFB (D size)
DEFB (E color mask)

Arguments: A =Color mask to write rectangle with
B =Y-size of rectangle in pixels
C =X-size of rectangle in pixels
D =Y co-ordinate for UL corner of rectangle
E =X co-ordinate for UL corner of rectangle

Description:
A rectangle of specified size of color mask is written at X,Y. RECTAN uses the MAGIC functions and is non re-entrant.

Example: Put up a 3 X 4 rectangle of color 2 at 15,13.
DO RECTAN
DEFB 15
DEFB 13
DEFB 3
DEFB 4
DEFB 10101010B

PROPRIETARY INFORMATION

David Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN WRITE ROUTINES

Virtually every video game involves the manipulation of animated figures. These figures are composed of patterns which are arbitrary pixel arrays. The write routines are used to transfer such patterns to the screen.

Five hierarchical levels of call are supported. The levels differ in the amount of preprocessing required by the user before calling. The highest level assumes that most of the parameters reside in a standard data structure, while the lowest level presumes that all arguments are in registers with all attendant transformations (such as relative-to-absolute conversion) already accomplished. The five levels are:

- (1) Write from a Vector
- (2) Write Relative
- (3) Write Variable Pattern
- (4) Write
- (5) Write Absolute

Two transformations of the pattern may be performed prior to writing. They are FLOP and EXPAND. FLOP is mirroring the pattern on the X-axis. EXPAND is the translation of a 1-bit per pixel pattern into a 2-bit per pixel pattern. Since many patterns are only two-color, this allows for more efficient pattern storage. FLOP and EXPAND can both be done at the same time.

Three writing modes may be used. They are PLOP, OR, and XOR. PLOP is a conventional store into RAM. If OR is optioned, the data being written is ORed bit by bit with whatever was already there. Similarly, if XOR is set, the pattern is XORed with that beneath. Use of OR or XOR takes slightly longer since a read before write must be performed.

Note that ROTATE is not currently supported in software due to space considerations.

STANDARD CALLING SEQUENCE

Every write routine uses a subset of the following argument/register assignment:

A = Magic Register
 B = Y Pattern Size
 C = X Pattern Size in Bytes
 D = Y Co-ordinate (0 - 101)
 E = X Co-ordinate (0 - 159)
 H = Pattern Address
 I = Vector Address

PROPRIETARY INFORMATION

Dave Nutting Associated Procs.

DO NOT REPRODUCE

PATTERN REPRESENTATION

The higher the level of the write routine, the more ancillary information is stored with the pattern. The following diagram shows what each level expects. Any bytes of lower address than the pointer for a given level, need not be specified.

Use Restrictions:

None of the write routines are re-entrant due to the Magic Register/Expander clobber.

SCREEN WRITE VWRITR
 WRITE RELATIVE FROM VECTOR

Calling Sequence: SYSTEM VWRITR
 or
 SYSSUK VWRITR
 DEFW (vector)
 DEFW (pattern)
 Arguments: HL=Pattern address
 IX=Vector Address
 Output: DE=Absolute address used
 A =Magic register used

Description:

The co-ordinates and magic register are loaded from the specified vector. (See vector routine document) The relative co-ordinates stored with the pattern are added to the co-ordinates from the vector. The pattern size is also taken from the pattern and writing proceeds.

Notes:

If expansion is to be done, the ON/OFF color must be set by the user before calling VWRITR.

PROPRIETARY INFORMATION

Dave Netting Associates Inc.

DO NOT REPRODUCE

SCREEN WRITE WRITR
WRITE RELATIVE

Calling Sequence: SYSTEM WRITR
or

SYSSUK WRITR

DEFB (X co-ordinate)

DEFB (Y co-ordinate)

DEFB (Magic Register)

DEFW (Pattern address)

Arguments:

HL=Pattern address

A =Magic register

D =Y co-ordinate

E =X co-ordinate

Output:

DE=Screen Address Used

A = Magic Register Use

Description:

The relative co-ordinates stored with the pattern are added to the co-ordinates passed in DE. Pattern size is taken from the pattern.

Notes:

If expansion is to be done, the ON/OFF color must be set by the user before calling WRITR.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN WRITE WRITP
WRITE WITH PATTERN SIZE SCARE UP

Calling Sequence: SYSTEM WRITP
or
SYSSUK WRITP

DEFB (X co-ordinate)
DEFB (Y co-ordinate)
DEFB (Magic Register)
DEFW (Pattern address)

Arguments: HL=Pattern Address
A =Magic register
D =Y co-ordinate
E =X co-ordinate

Output: DE=Screen Address Used
A =Magic Register Used

Description:
The pattern size is taken from the pattern.

Notes:
User must worry about ON/OFF color if expansion is used.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN WRITE WRIT
WRITE PATTERN

Calling Sequence: SYSTEM WRIT
or

SYSSUK WRIT
DEFB (X co-ordinate)
DEFB (Y co-ordinate)
DEFB (X pattern size)
DEFB (Y pattern size)
DEFB (Magic Register)
DEFW (Pattern address)

Arguments: HL=Pattern Address
A =Magic Register to use
B =Y pattern size
C =X pattern size
D =Y co-ordinate
E =X co-ordinate
Output: DE=Absolute address used
A =Magic Register used

Notes:
User must set ON/OFF color if using expansion.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

1033

SCREEN WRITE WRITA
WRITE ABSOLUTE

Calling Sequence: SYSTEM WRITA

or

SYSSUK WRITA

DEFW (Absolute address)

DEFB (X pattern size)

DEFB (Y pattern size)

DEFB (Magic Register)

DEFW (Pattern address)

Arguments:

HL=Pattern Address

A =Magic Register

B =Y Pattern size

C =X Pattern size

DE=Absolute screen address of upper left-hand corner of where to write

Notes:

This entry can be used for pattern writing to non-magic memory.

The value in A is not output to (MAGIC); it is only interrogated to decide whether FLOP or EXPAND.

PROPRIETARY INFORMATION

Date Printing Associates, Inc.

DO NOT REPRODUCE

SCREEN SAVE
SAVE AREA

Calling Sequence: SYSTEM SAVE
or

SYSSUK SAVE
DEFW (save area)
DEFB (X size)
DEFB (Y size)
DEFW Screen address

Arguments:

B = Y size of area to save
C = X size of area to save (in bytes)
DE = Address of save area
HL = Absolute address of upper left-hand corner
of area to save

Description:

SAVE is used to preserve what is 'underneath' a moving pattern. SAVE copies the indicated area of the screen to the save area. The sizes of the area which was saved is preserved in the first two bytes of the save area.

The save area size must be greater than or equal to the X-size times the Y-size plus 2.

The save area may be MAGIC or non-MAGIC.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN RESTORE
RESTORE AREA

Calling Sequence: SYSTEM RESTOR
or

SYSSUK RESTOR

DEFW (Save area)

DEFW (Screen address)

Arguments:

DE=Save area to restore from

HL=Absolute address of upper left-hand corner
of area to restore

Description:

RESTORE is the inverse of SAVE. The size of the area to restore is taken from the first two bytes of the save area.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN BLANK
BLANK AREA

Calling Sequence: SYSTEM BLANK
or

SYSSUK BLANK

DEFB (X size)

DEFB (Y size)

DEFB (Blank to)

DEFW (Blank address)

Arguments:

HL=Blank address (not M=0)

B =Data to blank to

D =Y size

E =X size

Description:

The specified area is blanked to whatever is passed in B.

PROPRIETARY INFORMATION

Dave Nutting Associates Inc.

DO NOT REPRODUCE

SCREEN SCROLL
 SCROLL WINDOW

Calling Sequence: SYSTEM SCROLL
 or

SYSSUK SCROLL
 DEFW (line increment)
 DEFB (# of bytes)
 DEFB (# of lines)
 DEFW (first byte)

Arguments: B =Number of lines to scroll
 C =Number of bytes on line to scroll
 DE=Line increment
 HL=First byte to scroll

Description:

This routine copies NBYTES from first line +INC to first line.
 Thus to scroll upward, HL points at the first line (which is over-
 written) and the line increment would be positive. To scroll downward
 HL points at the next line and the line increment would be negative.
 The value in HL is an absolute address calculated by:
 BASE OF SCREEN + NBYTES IN X OFFSET + (#lines offset*byte per line)

Note:

This routine can only be used to scroll one line at a time.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN ALPHANUMERIC
ALPHANUMERIC DISPLAY ROUTINES

HVGSYS provides several routines for the display of alphanumeric information. This section provides information which is common to all of the alphanumeric display routines.

The ASCII character code is used to represent all strings, with the following extensions:

Characters with hex equivalents in the range 1 - 1F are interpreted as tabulation codes which cause the character display routines to skip over N character positions before writing the following characters.

The characters 20H to 63H are displayed as 5 X 7 standard graphics with 3 pixels of horizontal spacing and 1 pixel of vertical spacing.

The characters between 64H and 7FH are interpreted by STRDIS as control codes which cause the contents of registers C, DE, and IX to be changed to the value that follow the string. See table accompanying STRDIS.

The characters between 80H and FFH are taken as references to a user supplied alternate character font.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

The following argument/register combinations are used by all of the alphanumeric display routines.

Register C contains the options byte formatted as shown below.

ENLARGE FACTOR specifies if the character is to be enlarged in size. The table below defines the possible values for this parameter.

XOR/OR WRITE - all writes are performed through magic memory. Use of one of these options causes the character to be ORed/XORed with what was beneath.

ON/OFF COLOR - all characters are stored one bit per pixel, but are written two bits per pixel by use of the expander. This field specifies the pixel values to translate the one bit per pixel representation into. For example, the value 1101 specifies that the foreground color is 11, and the background color is 01.

ENLARGE FACTOR	HOW MANY TIMES LARGER	ENLARGED SIZE OF SINGLE PIXEL
00	1	1 X 1
01	2	2 X 2
10	4	4 X 4
11	8	8 X 8

D register contains the Y co-ordinate and the E register contains the X co-ordinate. These co-ordinates give the address of the upper left-hand corner where the first character will appear. Upon return, these registers are updated to give the address of the character to the right, (or below if no more space exists on the line). This simplifies the composition of complex messages.

IX register contains the Alternate Font Descriptor. It is required only if alternate font is referenced in call. Each character must be stored in one-bit per pixel format.

The small (3 X 5) character set is displayed using this facility. A word in the system DOPE vector points at a standard alternate font descriptor for this character set.

The format of the alternate font descriptor is shown below.

IX → 0	BAS CHARACTER	EQUAL TO FIRST CHARACTER IN TABLE
1	X FRAME SIZE	CHARACTER SIZE IN BITS + X SPACING
2	Y FRAME SIZE	CHARACTER SIZE IN BITS + Y SPACING
3	X PATTERN SIZE	EACH CHARACTER TABLE ENTRY SHOULD BE OF SIZE X PATTERN*Y PATTERN SIZE
4	Y PATTERN SIZE	
5	CHARACTER TABLE ADDRESS	
6		

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN ALPHANUMERIC DISNUM
 DISPLAY BCD NUMBER

Calling Sequence: SYSTEM DISNUM
 or

SYSSUK DISNUM

DEFB (X)

DEFB (Y)

DEFB (options)

DEFB (extended options)

DEFW (number address)

Arguments:

B =Extended options

C =Standard alphanumeric options byte

DE=Standard X,Y co-ordinate

HL=Address of BCD number

*NOT LOADED

IX=Optional character font descriptor

Outputs:

DE=Update

Description:

This routine displays the standard BCD codes 0 through 9. In addition, the codes AH through FH are also defined. The interpretation for these codes are:

A = * B = + C = -
 D = - E = . F = /

If leading zero suppression is set, then instead of displaying a leading zero, a space is displayed. The first non-zero nibble encountered terminates leading zero suppression (including A - F). If the number is zero, a single zero is displayed.

If alternate font is set, the routine will display using codes between AAH and B9H (zero starting at B0H).

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN ALPHANUMERIC DISTIM
 DISPLAY TIME

Calling Sequence: SYSTEM DISTIM

or

SYSSUK DISTIM

DEFB (X co-ordinate)

DEFB (Y co-ordinate)

DEFB (Options)

Arguments: DE=X,Y co-ordinates

X =Option, (see note below)

IX=Alternate Font Descriptor (not loaded)

Outputs: DE=Update

Description:

This routine displays the system time (GMINS, SECS) at the co-ordinates specified in the form M:SS; where M=minutes, S=seconds. Seconds are optional.

Notes:

The small character set is used and one level of enlarge factor is permitted.

Options are the same as the alphanumeric display routine except that bit 7=1 to display colon and seconds; bit 7=0 to suppress colon and seconds.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN ALPHANUMERIC CHRDIS
DISPLAY CHARACTER

Calling Sequence: SYSTEM CHRDIS
or

SYSSUK CHRDIS
DEFB (X co-ordinate)
DEFB (Y co-ordinate)
DEFB (options)
DEFB (Character)

Arguments: A =ASCII character to display
C =Standard options byte
DE=Standard Y,X co-ordinates to begin at
*NOT LOADED IX=Optional alternate font descriptor address
Outputs: DE=Updated to next frame

Description:
This is the basic character display primitive. If tabulation is specified, the co-ordinates are updated but no actual writing occurs.

Notes:
Observe that IX is not loaded by the UPI SUCK facility. If alternate font is used, IX must be loaded with alternate font descriptor address.

Since this routine uses magic memory, it is not re-entrant.

SCREEN ALPHANUMERIC STRDIS
 DISPLAY STRING

Calling Sequences: SYSTEM STRDIS
 or

SYSSUK STRDIS

DEFB (X co-ordinate)

DEFB (Y co-ordinate)

DEFB (Options)

DEFW (String)

Arguments: HL=String address

C =Standard Options

DE=Standard Co-ordinates

*NOT LOADED IX=Alternate Font Descriptor Address

Outputs: DE=Update to next frame

Description:

The string pointed to by HL is displayed as optioned. The string is terminated by a zero byte.

Notes:

IX is not loaded by SUCK. STRDIS is not re-entrant.

STRDIS INTERPRETATION OF CODES 64H to 7FH

STRDIS responds to the character codes between 64H and 7FH. These codes are taken to specify that certain registers in the context block are to be set to new values. This facility is useful for changing size, write mode, screen co-ordinates, or fonts, during a single STRDIS call.

The following table specifies which registers are loaded for a given code. The order in which the new register data follows the code, is also represented.

64H	C	74H	IX,D
65H	E,C	75H	IX,E,D
66H	D,C	76H	IX,C
67H	E,D,C	77H	IX,E,C
68H	NONE	78H	IX,D,C
69H	E	79H	IX,E,D,C
6AH	D	7AH	IX
6BH	E,D	7BH	IX,E
6CH	C	7CH	IX,D
6DH	E	7DH	IX,E,D
6EH	D	7EH	IX,C
6FH	E,D,C	7FH	IX,E,C
70H	I		
71H	IX,E

SCREEN VECTORING - VECTORING ROUTINES

Most games involve moving patterns. Most moving patterns move along a line. The home video game operating system provides the vectoring routines to facilitate programming such pattern motion.

The vectoring routines work with a memory array called a vector. Represented within this vector are the co-ordinates of an object, the velocities of the object, and the necessary status information to control the object. By periodically invoking the vectoring routine, this data is updated and can be used to direct the motion of a pattern.

More formally, a vectored object possesses an X and Y co-ordinate. Associated with these co-ordinates are velocities ΔX and ΔY , which are added to X and Y every time increment. Since the screen is finite, there also exists two upper and two lower limits X_{LU} , X_{LL} , Y_{LU} , and Y_{LL} , the attainment of which requires some response.

The HVGSYS vectoring routine allows for two different responses to a limit attained. Either the sign of the delta is reversed or vectoring is stopped for this co-ordinate. This is specified by a flag byte. When attainment occurs this fact is indicated by a status byte. Also the co-ordinate is set equal to the limit that was attained, preventing over-shoot.

Utilization of the vectoring routines involves a number of user responsibilities. The user must properly initialize certain fields in the vector array. He must increment the time base byte, and periodically call the vectoring routine. Status bits must be checked and writing must be done.

To insure high-accuracy, co-ordinates and deltas are double-precision. The assumed binary "decimal point" is between the high and low order byte.

The following diagrams explain the layout of the vector array and the attendant user responsibilities.

PROPRIETARY INFORMATION

11				VBYH	
12		Y CHECKS MASK		VBYCHK	
13		OLD SCREEN ADDRESS		VBOAL	- MAINTAINED BY USER
14				VBOAH	

VECTOR STATUS DETAIL

ACTIVE VBSACT	BLANK VBBLNK	NOT USED					
------------------	-----------------	----------	--	--	--	--	--

ACTIVE

Set by user to indicate that vector is active. The vectoring routines will do no processing if reset.

BLANK

Must be initialized by user to reset state. Thereafter this bit is maintained by the LIMIT and VBLANK system routines.

CHECKS MASK DETAIL

NOT USED		LIMIT ATTAINED VBCLAT	NOT USED	REVERSE DELTA SIGN VBCREV	LIMIT CHECK VBCLMT
----------	--	-----------------------------	-------------	------------------------------------	--------------------------

LIMIT CHECK

Set by user to indicate that this co-ordinate is to be limit checked.

REVERSE DELTA

Set by user to indicate that when this co-ordinate attains it's limit, the sign of the associated delta is to be reversed. This can be used to cause objects to 'bounce' off barriers.

LIMIT ATTAINED

Set by system if the limit was attained this call. Otherwise it is reset. If the delta was not changed, either by Reverse Delta or user, this bit will stay set.

 DO NOT REPRODUCE

SCREEN VECTORING VECT
VECTOR OBJECT IN TWO DIMENSIONS

Calling Sequence: SYSTEM VECT
or
SYSSUK VECT
DEFW (Vector address)
DEFW (Limit table)

Arguments: HL=Limit table address
IX=Vector address (points at VBMR)

Output: C =Time base used
Z =True, if it did not move

Description:

If the vector is inactive, control is returned immediately. Otherwise VECTC is called for X, then Y. The zero status is determined by comparing the new co-ordinate value with it's old value. If the high-order byte changed, then the object moved. Zero status set if object did not move, reset if object moved.

PROPRIETARY INFORMATION

Dave Nutting Associates, Inc.

DO NOT REPRODUCE

SCREEN VECTORING VECTC
VECTOR A CO-ORDINATE

Calling Sequence: SYSTEM VECTC

or

SYSSUK VECTC

DEFW (co-ordinate address)

DEFW (Limit table)

Arguments: IX=Pointer to low-order element of delta for co-ordinate
HL=Limits table for this co-ordinate (if required)
C =Time base to use

Description:

This routine operates on the subset of the vector array associated with a single co-ordinate. This subset consists of the delta co-ordinate and checks mask. This entry is provided so special vectoring schemes may be implemented such as 1 dimensional or 3 dimensional vectoring.

This entry adds the delta to the co-ordinate time base times. It then performs the limit checks for the co-ordinate if optioned.

Note that this entry does not interrogate or alter any bytes in the vector array outside of the defined subset. Hence the active bit isn't checked.

PROPRIETARY INFORMATION

DO NOT REPRODUCE

SCREEN RELABS
 CONVERT RELATIVE CO-ORDINATES TO ABSOLUTE MAGIC ADDRESS AND
 SET UP MAGIC REGISTER

Calling Sequence: SYSTEM RELABS

or

SYSSUK RELABS

DEFB (Magic register value)

Arguments:

A =Magic register value to set

D =Y co-ordinate

E =X co-ordinate

Output:

A =Magic register value, with proper shift amount set

DE=Absolute memory addresses (MAGIC)

Description:

The low-order two bits of the X co-ordinate are inserted into the magic register value bit string. The absolute memory address corresponding to the co-ordinate is computed, taking into consideration the value of the flopped bit. The co-ordinate systems used are shown below.

Dave Nutting Associates Inc.

SCREEN RELAB1

CONVERT RELATIVE ADDRESS TO ABSOLUTE NORMAL ADDRESS

Calling Sequence: SYSTEM RELAB1

or

SYSSUK RELAB1

DEFB (Magic register value)

Arguments: A =Magic register value to combine with shift amount

D =Y co-ordinate

E =X co-ordinate

Output:

A =Combined magic register value

DE=Absolute normal address (not magic)

Description:

This routine is identical to RELAB except that a non-magic address is returned and the hardware magic register is not set. The flopped bit is interrogated and the flopped co-ordinate system is used, if optioned.

DO NOT REPRODUCE

HUMAN CONTROLS & KEYPAD SENTRY
SENSE TRANSITION

Calling Sequence: SYSTEM SENTRY
or
SYSSUK SENTRY
DEFW (Key mask address)
Arguments: DE=Keypad mask table

Description:
SENTRY checks for changes in the potentiometers (pots), control handles, triggers, keypad, semipots and counter/timers. It also takes care of blackout. Blackout is the automatic blacking-out of the screen after 25 seconds without a change. If SENTRY isn't called then the game will not black out.

SENTRY checks if TIMOUT equals 0 on entry and if zero, it goes to PIZBRK. If a key has gone down or a control handle changed, then TIMOUT is set to FFH.

HL should point at a keypad mask. The keypad consists of 6 rows by 4 columns.

Example mask of DEF8 011100B
just 0 - 9 DEF8 111100B
DEF8 011100B
DEF8 000000B

See diagram on following page.

6		Trigger 3 changed B=new value

PROPRIETARY INFORMATION
 Dave Autting Associates, Inc.

DO NOT REPRODUCE

Notes:

The potentiometers (pots) are debounced. New trigger value=Trigger off (0) or trigger on (10H). When switches are actuated simultaneously the order of return is: SCT7 to SCT0, SF7 to SF0, SP0 to SP3, SSEC, SKYU, SKYD, SJ0, ST0, SJ1, ST1, SJ2, ST2, SJ3, ST3.

HUMAN CONTROL PIZBRK
"COFFEE BREAK" BLACK OUT SCREEN AND WAIT FOR KEY

Calling Sequence: SYSTEM PIZBRK

or

SYSSUK PIZBRK

Input: NONE

Output: NONE

Description:

This routine black out the screen and waits for either a key press or a trigger or a joystick change.

This function should be called whenever a "hold until further notice" is needed.

All keys on the keypad are enabled. Interrupts are disabled on entry and enabled on exit. It is a good idea to reset any 60th of a second timers on exiting PIZBRK.

INTERRUPT MUSIC PROCESSOR

The music processor can be thought of as an independent CPU handling all output to the music/noise ports. The MUZCPU has 4 registers:

- MPC: Like all program counters, points to the next data byte to fetch.
- MSP: Like a stack pointer, points to return addresses on the stack.
- DURATION: Is loaded at the start of a note and then decremented every 60th of a second.
- VOICE: Is a status register. It tells which voices (tones) to load with what data.

The voices status register is shown below. Execution proceeds right-to-left. Make sure that you always have at least one PC incrementing bit or load on.
